EPIDEMIOLOGICAL COMMENTS

Risk analysis indicates that the region is a high-risk area. Indeed, the region is a cross-border zone that recorded several outbreaks in both domestic and wild animals in 2013 and 2023, during the winter period, which is the high-risk period. Entomological surveys have also revealed the presence of vectors (Aedes, Culex). Note on 21/10/2025: For consistency with the information already published, the reason for notification is amended from unexpected change or increase to recurrence of the disease.
